

WHERE IDEAS BECOME REALITY

Corteva Agriscience™ believes that the global scientific community can do truly innovative work when we collaborate. Join us and other thought leaders from around the world to stimulate the development of groundbreaking and sustainable agricultural solutions.

About Open Innovation

We use the science of the lab and the land to maximize productivity and sustainability of the world's farmland to enhance food security.

We accomplish this through two main strategic approaches:

- Collaborate with thought leaders and innovators around the world to access and develop the most innovative technologies; and
- Rapidly deploying those innovative technologies through organizations that are good stewards of those technologies.

We maintain an unwavering commitment to the development and deployment of innovative and sustainable agricultural solutions for the greater good.

Collaborating with Corteva

Growing long-standing relationships happens when we listen to our customers and develop strong R&D collaborations. We strive to do what's right: operating with fairness, honesty and openness with all our stakeholders and collaborators.

How We Create Value

We form alliances between our scientists and innovators to identify, develop and implement solutions that address the challenges growers face, and address consumer desires. These solutions help our customers and stakeholders across the value chain exceed their goals through new markets and opportunities.

Our Commitment

We aim to be a preferred collaborator and responsible environmental steward by producing the best products on the market with the most innovative technologies. It's a commitment that helps us ensure current and future food, feed, fuel and materials are produced in a safe and sustainable way.

Sustainability

Our core values—safety and health, the highest ethical standards, environmental stewardship and respect for people—are the foundation for everything we do, and ensure that we take a thoughtful approach to our sustainability efforts.

Have an Idea or Proposal to Submit to Us?

Submit an Idea for Collaboration

Traits

Leveraging biotech, native and genome editing approaches to deliver robust trait solutions across insect control, disease control, herbicide tolerance, output and agronomic trait areas

Breeding

90+ years of innovation and expertise for genetic gain

Enabling Technologies

CRISPR-Cas technology, advanced genomics, phenotyping tech, and more to help enhance and accelerate product development

Biologicals

Applying leading edge genomics tools to identify microbes and consortia that improve agronomics and tolerance to abiotic and biotic stresses

Digital Solutions

Differentiating and predictive tools that generate actionable outputs

Crop Protection

We innovate in the areas of new active ingredients and formulations for crop protection
